

Q : What is the configuration of Pegasus's left access control system ?

The products are a series of access controller with time recording function, designed to interface with external relay controller box, which can offer 8, 24 relay contacts either in form A, (NO: Normal open) or form B (NC: Normal closed) to control the switch panel in the lift. The floors allowed for personal access can be programmed through the keypad in the controller or downloaded thru PC.

The lift controllers can be configured through RS-232C, RS-422 or RS-485 interface. If it can be configured through PCP-832-xx for multi-channel converter by combining with other Pegasus on-line controllers such as PP-6750/PP-5707/PP-2752/PP-3760 series to build the complete access control system, below is the system configuration for reference.
